

Supplemental Figure S12: Correlation of Z-linked gene-specific dosage compensation with gene-level P_{CT} score. Distributions of chicken male/female expression ratio, normalized to that of human and anolis (y-axis) as a function of mean gene-level P_{CT} quartile (x-axis) for all expressed Z-linked gene with no W homolog. Expression ratios are plotted on a $\log_2$ scale; values closer to 0 imply more effective dosage compensation following W gene loss.
