

Supplemental Figure S15: Correlation of Z-linked gene-specific dosage compensation with human-chicken-conserved site excess. Distributions of chicken male/female expression ratios, normalized to those of human and anolis (y-axis) for expressed Z-linked genes with no W homolog with (left) or without (right) an excess of human-chicken-conserved miRNA sites. ** $p < 0.01$, *** $p < 0.0001$, Wilcoxon rank-sum test.
